MEASUREMENTS

As it is not currently possible to industrially produce tailored back protectors, back protector must be worn by people with anthropometric characteristics lying within a certain range. A back protector is suitable for a person if its height does not exceed the seventh cervical vertebra and if the minimum area of the model is related to a waist shoulder height greater than or equal to that of the person.

CHOOSE THE SIZE OF A PROTECTOR CORRECTLY

The choice of the correct size of a back protector, according to the standard, is determined by the Waist-Shoulder height. This is the difference in height between the midpoint of the shoulder and the waistline (immediately above the hipbone). According to the Dainese standard, this measurement must then be qualified by the correct dimension of waist strap, identified by a size (ex: XS, S, M...). It is not correct to define the measure of the backprotector on the basis of the height of the person, because even if the back could have the same dimension, the legs could have a different lenght.
